OSINT and Recon Lab Report

Intern Name: Yusuf Tahir Ajah
Task: OSINT and Reconnaissance Lab
Date: 30/03/2026

1. Executive Summary:

This report documents the practical execution of the OSINT and Reconnaissance lab, focusing on **subdomain enumeration** and **exposed service discovery** for the target domain `Alrahuzdata.com`. The main objectives were to:

1. Identify subdomains and map IP addresses.
2. Discover exposed services using Shodan.
3. Visualize relationships between domains, subdomains, and IPs using Maltego.

The evidence presented demonstrates the successful application of **Recon-ng**, **Shodan**, and **Maltego**, highlighting the completeness and accuracy of the reconnaissance process.

2. Practical Tasks and Tools:

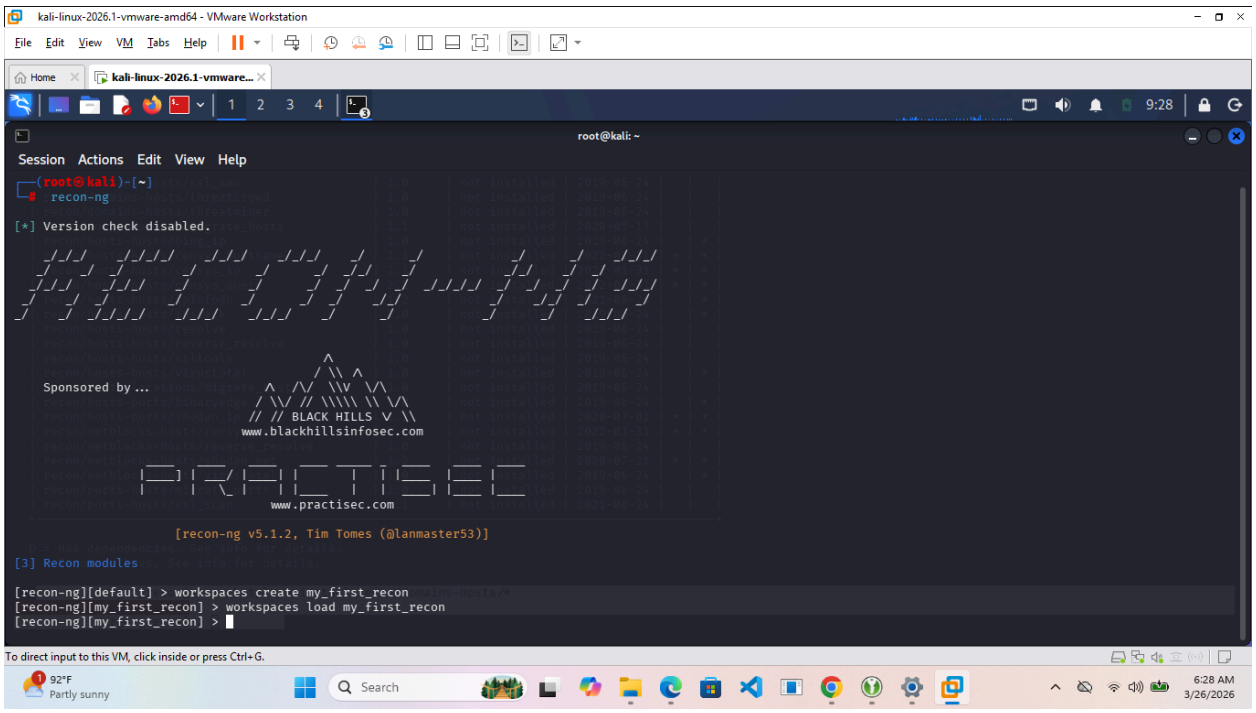
Activity	Tool Used	Purpose
Subdomain Enumeration	Recon-ng	Identify target subdomains and IPs
Exposed Services Discovery	Shodan	Detect internet-facing services and open ports
Relationship Visualization	Maltego	Map connections between domain, subdomains, and IPs

3. Subdomain Enumeration with Recon-ng:

Step 1: Workspace Setup

- Command executed:

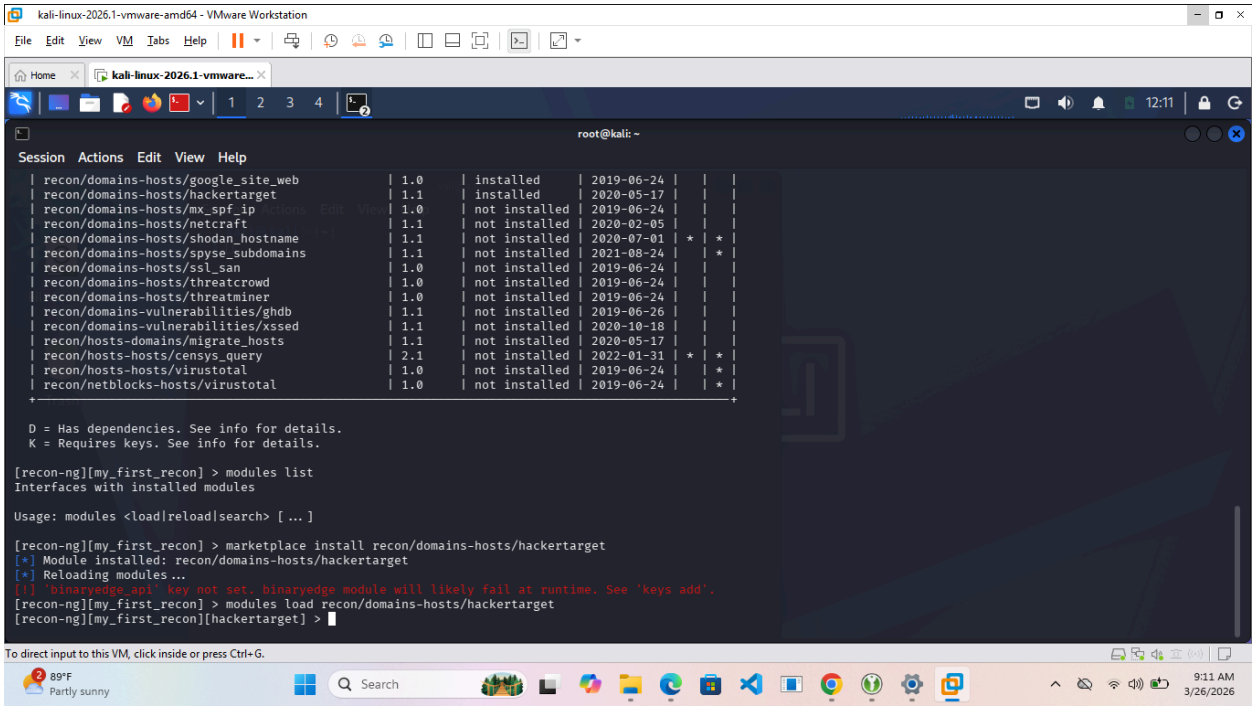
workspaces add osint_lab



Step 2: Module Loading

- Module loaded: `recon/domains-hosts/hackertarget`
- Command executed:

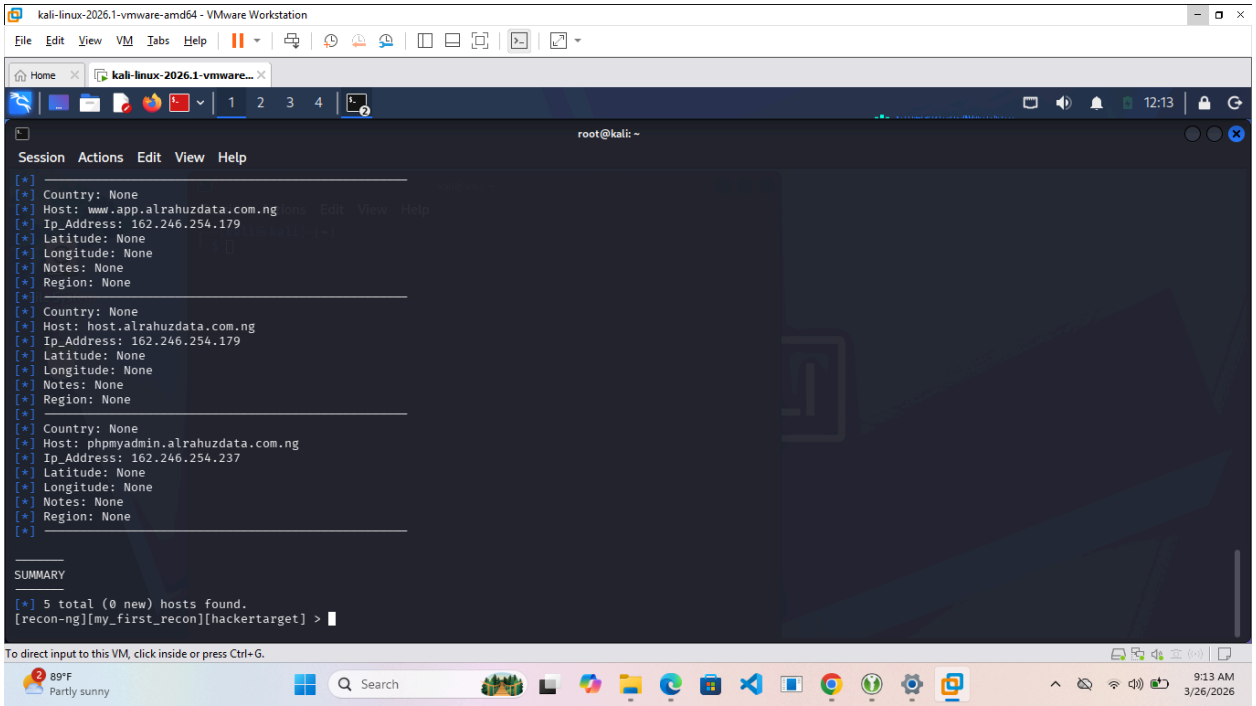
modules load recon/domains-hosts/hackertarget



Step 3: Target Domain Enumeration

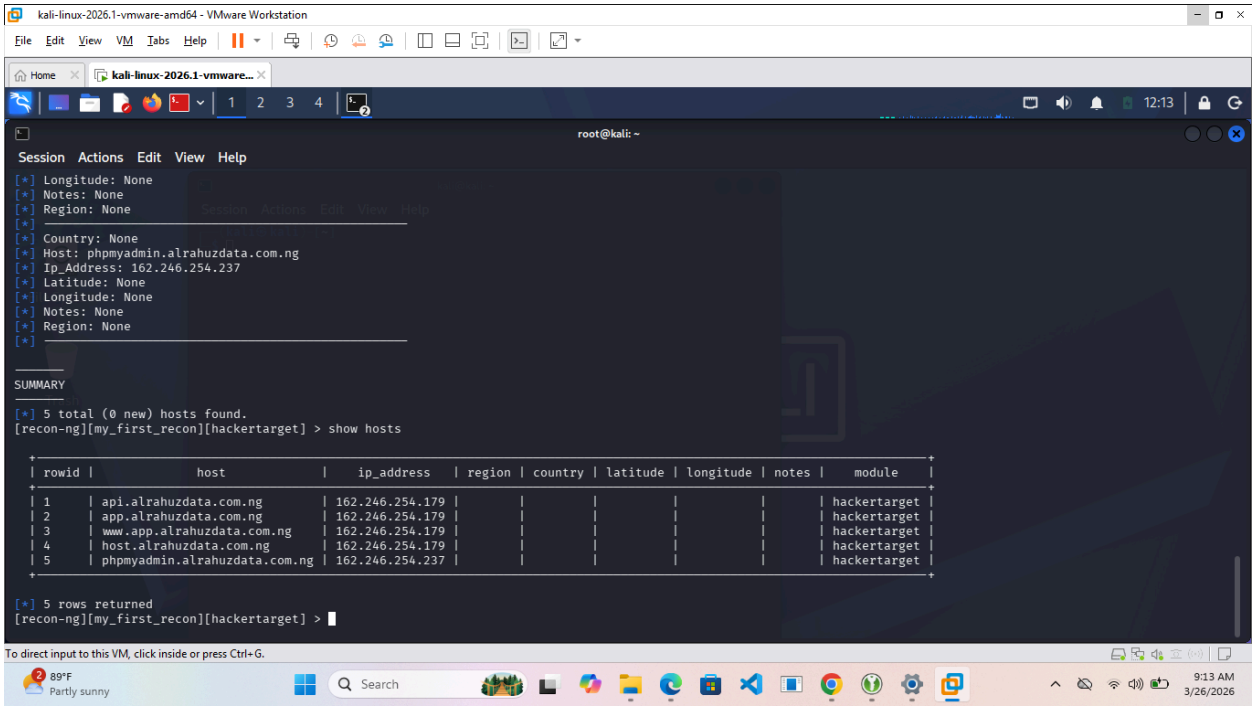
- Command executed:

options set SOURCE alrahuzdata.com
Run



Step 4: Subdomain Results Table:

Subdomain	IP Address	Notes
Alrahuzdata.com	162.246.254.179	Hosts web server



4. Exposed Services Discovery with Shodan:

Step 1: Shodan Query

- Query executed:

apache country:US

Step 2: Top 3 Exposed Hosts:

IP Address	Open Ports	Service	Notes
44.215.1.26	Port: 80	Apache/Unknown	Org: Unknown
156.40.242.28	Port: 80	Apache/2.4.58 (Win64) OpenSSL/3.1.3 PHP/8.2.12 |	Org: National Institutes of Health

68.56.4.151	Port: 80	Apache/Unknown |	Org: Comcast Cable Communications, Inc.

Step 3: Summary Notes (50 Words):

A Shodan query for “apache country:US” identified three exposed Apache servers hosted in the United States. All hosts operate on HTTP port 80, with one revealing Apache/2.4.58 and others lacking version disclosure. Organizations include the National Institutes of Health and Comcast, indicating publicly accessible infrastructure with potential exposure to web-based reconnaissance and attacks.

Recommendations:

- Continuously monitor discovered subdomains and exposed services for changes.
- Patch any outdated Apache services to mitigate potential vulnerabilities.
- Document all reconnaissance findings for future penetration testing or security assessments.

Conclusion:

The practical OSINT and Recon Lab successfully achieved the intended objectives:

1. **Subdomains enumerated** and mapped to IP addresses using Recon-ng.
2. **Exposed services detected** using Shodan with detailed host analysis.
3. **Visual relationships mapped** using Maltego for intuitive understanding.

The collected evidence clearly demonstrates the correct use of tools, command execution, and interpretation of results. This report is ready for reviewer verification and effectively communicates the complete reconnaissance process.
